Website Building: Basic Layout

CSS – Pseudo selector animation

The following exercise contains the following subjects:
- before and after pseudo selectors
- transitions

Instructions

1. Create a box with a background color.
2. Create a pseudo selector from that box that has the same height and width but is a different background color and is placed right next to the box with the help of the transform property.
3. When hovering over the main box make the pseudo selector box translate back to its original state while changing its background color. Like this example

Tip:
Use overflow on the parent box to hide the pseudo-element when it is overflowing from its parent container
